* *Dynamic Data
Exchange (DDX)* or,
rather *Data Interchange
in General* (DIG) is a

registered trademark of Microsoft and offers various functions for the exchange and visualization of data between different data formats. It is used to exchange data between AutoCAD and other tools such as Microsoft Office.

Besides a programming API, DDX is available as part of the Standard, Premium or Ultimate editions of AutoCAD. However, it is not officially supported by Autodesk and is not covered by their Technical Support Guarantee. * *Structured

Query Language* (SQL) is a programming language used to query a database.

It is the predominant language for data management in the majority of database systems. SQL has been adopted by AutoCAD to facilitate the input of data

from external sources. It can query databases in any of the file formats that AutoCAD uses. This includes *.dwg, *.idx*, *.dxf, *.dwt, *.dwg and *.dwg3*. # Chapter 10 AutoCAD Reference and Documentation _The goal of this chapter is to get

you to know the product well and make you familiar with the text file called Reference.rtf, which is where AutoCAD stores information about the products that it offers.

Most of the information provided by this file is in a form that you can import

to a word processor or other text-based applications. You'll get to know this file, as well as learn how to customize it and how to make it more user-friendly. The last part of this chapter is about Autodesk's own documentation. Here,

you'll find information on the documentation you may have to read before starting to use the application. Many pages are devoted to describing how to customize the application_. In this chapter, you'll learn about

What's New In AutoCAD?

Choose from a variety of
settings in Markup Import
and Markup Assist that
control how feedback is

imported. You can choose to import feedback from only specific areas or an entire drawing. With Markup Assist, you can import feedback to files without an active drawing session, without exporting or closing your AutoCAD session. With the new

Markup Import and Markup Assist, it's now possible to send and incorporate feedback from printed paper or PDF files. In addition, you can import feedback from files created with any other 3D application. Since feedback from paper or

PDF files is only a single input, it's easier to incorporate any changes into a drawing that has been locked, minimized or sent to the 3D printer. There are two ways to import feedback from a paper or PDF file. Either you can choose from the

Markup Import and Markup Assist window, or you can import feedback via the command line. Using the command line, you can import multiple files (including multiple PDF files) into a single drawing, or import an entire drawing from a PDF

file or multiple PDF files.
Importance of No
Consuming Serial Mode
On the Post Processing
tab of the ribbon, there is
a new option, “Preserve
No Consuming” (Enable
No Consuming). (Preserve
No Consuming is new with
AutoCAD 2023.) Preserve

No Consuming enables you to convert a drawing that has been sent to the 3D printer into a working drawing, without having to repeat any steps.

Converting a model that has been printed into a working drawing is made easier by the fact that you

do not have to remember what commands are executed during 3D printer printing. With the print job, AutoCAD generates a 3D model in a single drawing and saves it on the server. The 3D model does not consume any drawing resources or

storage space on the system. The entire 3D model is stored only on the server. When you open the 3D model on the system, it appears in the web browser and can be used as if it were saved in the local drawing file. The 3D model does not

consume any storage space on the system. You can use the option “Preserve No Consuming” to convert a model that was printed on the server into a working drawing. While converting, AutoCAD copies all the resources and the drawing

settings from the original
